Professional Summary

DevOps Engineer with 2.5+ years of experience designing, automating, and operating cloud infrastructure across AWS and Azure, currently working in Site Reliability Engineering. Skilled in CI/CD pipeline development, Kubernetes orchestration, Infrastructure as Code, and containerized deployments using Terraform, Azure Bicep, Docker, Helm Charts, and Kubernetes. Experienced in production monitoring and incident response, managing multi-environment systems, reducing cloud infrastructure costs, and improving deployment efficiency through automation with Python and Bash.

Core Competencies

- Cloud Infrastructure (AWS, Azure)
- Infrastructure as Code (Terraform, Azure Bicep)
- CI/CD Automation (GitHub Actions, Azure DevOps Pipelines, ArgoCD)
- Containerization & Orchestration (Docker, Kubernetes, Helm Charts)
- Kubernetes Management (kubectl, Helm, Cluster Maintenance)
- Monitoring & Deployment Strategies
- Incident Response & Runbook-Driven Operations
- Multi-Environment Management (Dev, Test, Staging, Production)
- Cost Optimization & Resource Management
- Backend Development & APIs
- Infrastructure Automation & Cloud Provisioning

Technical Skills

Cloud Platforms: AWS, Azure
DevOps & Infrastructure Tools: Terraform, Azure Bicep, Azure CLI, GitHub Actions, Azure DevOps Pipelines, ArgoCD, Helm Charts, kubectl, Docker, Kubernetes
Programming Languages: Python, Bash Scripting, Shell Scripting, Java, JavaScript, PHP
Frameworks & Technologies: React, React Native, Expo CLI, Express.js
Monitoring & Observability: New Relic, Prometheus, Grafana, Loki
Integration: Orderful (EDI)
Operating Systems: Windows, Linux
Concepts: CI/CD, Infrastructure as Code (IaC), Cloud Computing, OOP, SOLID Principles, Containerization, Automation

Professional Experience

Bridgenext India Pvt. Ltd.

Analyst SRE

Sep 2026 – Present

- Monitor production alerts in New Relic and triage each one to identify the underlying cause.
- Remediate issues following runbooks by restarting services, evicting pods, and scaling workloads up or down to restore service quickly.
- Escalate issues beyond runbook scope to the owning engineering teams with a clear record of the diagnostics and remediation steps already performed.
- Manage high-priority incidents (HPIs), posting timely and structured status updates throughout the incident lifecycle.
- Track and troubleshoot EDI transaction flows on Orderful for business-critical client integrations.
- Perform dedicated checks on high-priority client environments, including a one-hour sanity check each shift to catch issues before customers are affected.
- Build observability dashboards in New Relic using Terraform (dashboards as code) and the New Relic UI.

AutomationHQ

Mar 2024 – Sep 2026

Lead DevOps Engineer

Mar 2025 – Sep 2026

- Architected and managed AWS and Azure infrastructure using Terraform and Azure Bicep, with Bash scripts automating routine tasks, log analysis, and deployment health checks.

- Designed end-to-end CI/CD pipelines in GitHub Actions and Azure DevOps Pipelines promoting releases across environments (dev → staging → production), and standardized environment configurations to reduce deployment failures.
- Reduced AWS cloud costs by **up to 60%** (**from $300–400 to about $150 per month**) through rightsizing, resource optimization, and monitoring.
- Reduced Azure infrastructure costs by **75%** (**from about $400 to under $100 per month**) by redesigning the architecture and eliminating unused resources.
- Operated a 4-node Amazon EKS cluster split across 2 Availability Zones, exposing only the gateway service (deployed in both zones) while all other services stayed internal; Helm charts defined Horizontal Pod Autoscalers, Pod Disruption Budgets, and health probes tracked by ArgoCD.
- Restructured the legacy AWS Terraform configuration (VPC, subnets, 4-node EKS cluster) into a clean module layout and brought manually created resources under Terraform management.
- Implemented GitOps deployments with ArgoCD, connected to the Helm chart repository, to deploy the microservices to EKS.

Software Developer & DevOps Intern
Mar 2024 – Mar 2025

- Built an Azure Bicep infrastructure repository for Java microservices on Azure Container Apps, with Cosmos DB, secrets storage, a Selenium Grid container app, Blob Storage for the frontend and file sharing, and ACR for Docker images.
- Added GitHub Actions workflows for on-demand deployment and teardown, replacing manual Bash and PowerShell provisioning with a one-click deployment.
- Delivered a custom deployment for an enterprise client in a private, VPN-only Azure environment: Bicep templates run through GitHub Actions and PowerShell, provisioning Java microservices on Azure Container Apps with ACR and Cosmos DB.
- Troubleshot and optimized cloud systems, and wrote Bash scripts to automate repetitive tasks.

Projects

bicepBrew | Azure Bicep, GitHub Actions

- Built a hands-on learning resource that helps interns master Azure Bicep by pairing theory with practical templates.
- Implemented GitHub Actions workflows that deploy the templates automatically, demonstrating IaC best practices.

Cal-Get | React Native, Expo CLI, Express.js, JWT

- Built a cross-platform Web, Android, and iOS app from scratch with custom themes, reusable components, and authentication screens.
- Designed secure REST APIs in Express.js for signup, sign-in, and session management using JWT authentication and bcrypt hashing.

Education

Master of Computer Applications (MCA)
Savitribai Phule Pune University, Pune — 2022 – 2025
Finalist, IT Division Coding Contest at Kakushin, Nomura Services Pvt. Ltd. (July 2023)

Bachelor of Business Administration (Computer Application) – BBA (CA)
Indira College of Commerce and Science, Pune — 2019 – 2022
CGPA: 7.85 | Percentage: 73.55%
